JPEGtoPICT

JPEGtoPICT converts all JPEG files in a folder to jpeg-compressed
PICT files, which are placed in a new folder.

It is just an interface to several Rinaldi externals.

JPEGtoPICT requires HyperCard 2.1 or later and QuickTime.

Scripting

JPEGtoPICT f, removeExt, creator, createIcons, showProgress

f: full path name of the folder to convert
removeExt: if true ".jpg" and ".jpeg" extensions will be removed
                from the converted files, default is true
creator: the creator to set for the converted files, default is SimpleText
createIcons: whether to create custom icons, default is false
showProgress: whether to show the progress bar, default is false

If the conversion was ok, the result is the full pathname of the
new folder containing the pictures (check if "•" is in the result).

The stack contains an XFCN that checks if QuickTime is present (public domain).
